

Bermudagrass Seed vs. Sprigs

Establishment Rate

Certified Coated Turf-Type Bermudagrass Seed
approx. 1,000,000 seeds per pound
Plant 2# seed / 1,000 sq. feet
= 85# / Acre = approx. 14 seeds / square inch

Each seedling is capable of reaching
1 - 3 feet across within 6 - 8 weeks
with correct temperature, water, etc.

Possibly half the seeds are planted too
deep or too shallow or are eaten by
ants, birds, etc. Still 7 seeds per square
inch - each seedling capable of
becoming 1 - 3 feet across in 6 - 8
weeks

* Hybrid bermudagrass sprigs - initial application population will **never** match seedling population on a golf course fairway, sports field, park, school, commercial property, etc.

Usual sprig application rate would be 2 - 3 live nodes per square inch (hydro mulched), or fewer with common sprig planters.
