

Superior New Transitional Ryegrasses

TransFix, the new Transitional (Intermediate) ryegrass from Seed Research of Oregon, represents a new level of performance for this species. The result of ten years of breeding, **TransFix** provides a dark green, high density turf. **TransFix** germinates faster than perennial ryegrasses and also germinates at lower soil temperatures which makes it ideal for problem-solving in both cool- and warm-season applications.

TransFix, in combination with high quality perennial ryegrasses, is available in the **Champion® EZEE** and **Magnum EZEE** blends. These 70/30 combinations (70% Champion® / 30% TransFix / TransCend) provide a superior playing surface that will transition more readily when summer temperatures return. **Champion® EZEE** is a superior product to formulations containing "weak" perennials. This is a product designed for overseeding success.

Color comparison between **TransFix**, Gulf Annual and **Annuity** (Seed Research of Oregon Turf-Type Annual) – June 2013

Champion® EZEE is an excellent choice for warm season overseeding of golf courses, sports turf and home lawns. Winter playability is excellent. Repair of damaged areas is superior given lower soil temperature adaptation. **Champion® EZEE** with **TransFix** provides an economical benefit too; it's perfect for those with tight budgets looking for the quality of the **Champion® Brand**. At transition time the 70/30 blends deliver a gradual progression back to bermudagrass.

STANDARD FORMULATIONS:

Champion® EZEE 70/30

70% Champion® Perennial Ryegrass
30% TransFix/TransCend Intermediate Rye

Champion® EZEE 50/50

50% Champion® Perennial Ryegrass
50% TransFix/TransCend Intermediate Rye
